AF410459 5883 bp mRNA linear Homo sapiens CD109 (CD109) mRNA, complete cds. AF410459 AF410459.1 GI:19071208

REFERENCE AUTHORS TITLE Homo sapiens (human)
Homo sapiens
Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Eukaryota; Metazoa; Chordata; Catarrhini; Hominidae; Homo.

1 (bases 1 to 5883)
Lin,M., Sutherland,D.R., Horsfall,W., Totty,N., Yeo,E., Nayar,R.,
Wu,X.F. and Schuh,A.C.
Wu,X.F. and Schuh,A.C.
Cell surface antigen CD109 is a novel member of the alpha(2)
macroglobulin/C3, C4, C5 family of thioester-containing proteins
Blood 99 (5), 1683-1691 (2002)

NEDO human cDNA sequencing project supported by Ministry of

Economy, Trade and Industry of Japan; cDNA full insert sequencing:

Research Association for Biotechnology (RAB); cDNA library

construction: Helix Research Institute (HRI) (supported by Japan

Key Technology Center etc.); 5'-& 3'-end one pass sequencing: RAB,

HRI, and Biotechnology Center, National Institute of Technology and

Evaluation; clone selection for full insert sequencing: HRI and

RAB; annotation: HRI and RAB.

```

Pred. No. is the number of results predicted by score greater than or equal to the score of the No. chance to have a result being pri printed,

and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to novel transforming growth factor (TGF)-betal binding reagent which comprises a glycosylphosphatidyl inositol (GPI)-anchored TGF-betal binding protein referred to as r150 which acts as an accessory receptor of TGF-beta. The invention is used for negatively modulating TGF-beta activity, and thus for treating conditions characterised by overproduction of TGF-beta, such as cancer. Antisense molecules of the invention are used for increasing TGF-beta availability and increase graft success. The present sequence is a gene encoding human r150 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel transforming growth factor (TGF)-beta 1 binding reagent which comprises r150 protein which acts as accessory receptor of TGF-beta useful for negatively modulating TGF-beta activity, and thus for

New isolated oligonucleotide binding to having a single nucleotide polymorphism and/or Govb allele, useful for treating a region of CD109 nucleic acid that distinguishes a Gova blood disorders e.g. alloimmune

Claim 6; Page 23-29; 69pp; English.

The present invention relates to a sequence capable off binding specifically to a CD109 nucleic acid which has a single nucleotide polymorphism that distinguishes the Gova and Govb alleles. Detection of the Gov genotype is useful for detecting whether the subject has or is at risk of a blood disease, disorder or abnormal physical state, such as bleeding, or increased risk of bleeding, due to alloimmune destruction of blood platelets, e.g., post-transfusion purpura, post-transfusion platelets refractoriness or neonatal alloimmune thrombocytopenia. The nucleic acid and polypeptide are useful for Gov genotyping or phenotyping individuals. The present sequence is the Gova coding sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to isolated nucleic acid molecules encoding CD109 CD polypeptides. These nucleic acid molecules include the human cDNA CS sequences comprising CD109 K1, CD109 K1-H7, CD109 K15 or their variants. CC CD109 is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5 CC family of thioester-containing proteins. The CD109 polypeptides can be CC expressed by standard recombinant methodology. The CD109 nucleic acid, CC CD109 polypeptide or its minmetic, or the anti-CD109 antibody is useful CC contracting or detecting a disease or disorder, e.g. conditions CC associated with endothelial activation, platelet activation, activation of the coagulation or fibrinolytic systems, activation of 1 lymphocytes and of the complement system, quantitative or qualitative abnormalities CC of platelet function, increased or impaired platelet aggregation and CC citivation, increased or impaired platelet aggregation and CC citivation, increased or impaired activation of the coagulation and CC citivation, thrombosis, embolism, peripheral vascular disease, cc thrombocytopenia, thrombocythemia, autoimmune diseases, organ CC transplantation, or bone marrow transplantation. The CD109 nucleic acids or their antisense nucleotide sequence are useful in gene therapy for treating these conditions. The present sequence represents the human CC CD109 K1 CDNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Percent Similarity:

```

The invention relates to novel transforming growth factor (TGF)-betal binding reagent which comprises a glycosylphosphatidyl inositol (GPI)-anchored TGF-beta binding protein referred to as r150 which acts as an accessory receptor of TGF-beta. The invention is used for negatively modulating TGF-beta activity, and thus for treating conditions characterised by overproduction of TGF-beta, such as cancer. Antisense molecules of the invention are used for increasing TGF-beta availability and increase graft success. The present sequence is human blood cell surface antigen, CD109 encoding DNA. CD109 is a variant of r150 sequence. Note: This sequence is stated to encode human CD109 protein shown in figure 17 of the specification, but this does not appear to be the case. Disclosure; Fig 17; 127pp; English.

Sequence 5882 BP; 1696 A; 1173 C; 1241 G; 1772 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          US-10-020-095-4 (1-1428) x ABQ79966 (1-5895)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC polypeptides. These nucleic acid molecules include the human cDNA CC sequences comprising CD109 K1, CD109 K1-H7, CD109 K15 or their variants. CC CD109 is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5 CC family of thioseter-containing proteins. The CD109 polypeptides can be compressed by standard recombinant methodology. The CD109 nucleic acid, CC CD109 polypeptide or its mimetic, or the anti-CD109 antibody is useful CC for treating or detecting a disease or disorder, e.g. conditions CC associated with endothelial activation, platelet activation, activation of the coagulation or fibrinolytic systems, activation of T lymphocytes and of the complement system, quantitative or qualitative abnormalities of platelet function, increased or impaired platelet aggregation and CC fibrinolytic systems, or impaired activation of the coagulation and/or CC fibrinolytic systems, or impaired activation of the coagulation and/or CC fibrinolytic systems, or impaired activation of the coagulation. These CC are also useful for treating cardiovascular disorders, stroke, myocardial confirmation, thrombosis, embolism, peripheral vascular disease, creaming these conditions. The present sequence represents the human CC treating these conditions. The present sequence represents the human CC chica the conditions. The present sequence represents the human cconditions.

The invention relates to novel transforming growth factor (TGF)-betal binding reagent which comprises a glycosylphosphatidyl inosicol (GPI)-anchored TGF-betal binding protein referred to as r150 which acts as an accessory receptor of TGF-beta. The invention is used for negatively modulating TGF-beta activity, and thus for treating conditions characterised by overproduction of TGF-beta, such as cancer. Antisense molecules of the invention are used for increasing TGF-beta availability and increase graft success. The present sequence is human r150 protein encoding DNA.
                                                                                                                                                                                                                                                                            Novel transforming growth factor (TGF)-beta 1 binding reagent which comprises r150 protein which acts as accessory receptor of TGF-beta, useful for negatively modulating TGF-beta activity, and thus for treating cancer -
